

# New features for OpenMRS

I researched about other medical records systems and they were:-

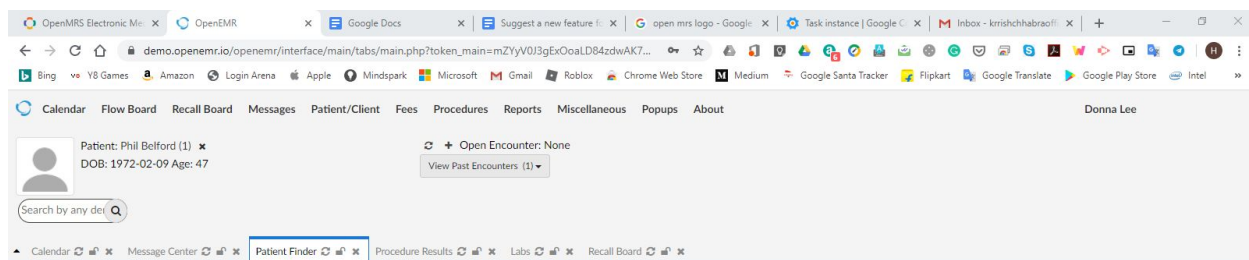

- GNU Health
- OpenEMR

## Feature-1

OpenMRS should add a tabs option where we can open multiple options at a same time. Such as if a doctor is checking the vitals of a patient and at the same moment if he/she wants to schedule the appointments then he/she has to close the vitals tab and then he has to open the vitals tab again. I think that this feature should be added as it saves time.

## Feature-2

My feature-2 is based on my feature-1. In this feature, It will be like as soon as the doctor logs in two new tabs will open up and they will be Calendar and Message Center. The calendar will help in taking a look at the appointments for the day message centre will help in sending messages to other staff and patients.
